Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      AAT39047-T39054 represent the coding sequences for the enzymes of the invention. The encoded enzymes possess cellulytic (particularly endoglucanase) activity. Cellulytic enzymes are involved in the the hydrolysis of cellulose, and are synthesised by a large number of microorganisms and plants. The enzymes of the invention containing the conserved catalytic regions (such as AAW04913) exhibit improved performance, e.g. 50 times higher performance, compared to multiple domain enzymes. The enzymes can be used for the treatment of fabrics or textiles, preferably for preventing backstaining, for bio-polishing or for stone-washing cellulosic fabric. They can also be used for the degradation or modification of plant matterial, such as cell walls. They can also be used in the treatment of paper pulp preferably for debarking, defibration, fibre modification, enzymatic de-inking or deparking, defibration, fibre modification, enzymatic de-inking or

This cDNA encodes a monocomponent endoglucanase. This is a cellulolytic content of centyme belonging to the fungal species Thielavia terrestris. This can be cused in the process of invention of providing a pair of jeans made from the colour density of content of the fabric that has localised variations in the colour density of the fabric. The process involves providing the jeans with a stone-washed content of the colour density of the fabric. The process involves providing the jeans with a stone-washed content of the process involves providing the jeans with a stone-washed content of the process involves providing the jeans of a first area of the jeans fabric is less than 1, and the reflection of a first area of the jeans fabric is less than 12 percent. The process comprises selecting the jeans fabric is less than 12 percent. The process comprises selecting the desired textile cutting pattern for jeans garment, positioning the pair contoner that the pair of jeans to newly manufactured dyed twill fabric, cutting the jeans contoner parts, sowing the pair of jeans, optionally subjecting the pair of jeans to a desizing treatment, and subjecting the pair of jeans to an desizing treatment, and subjecting the pair of jeans to an desizing treatment, and subjecting the pair of jeans to an advecus medium essentially free of bleaching chemicals. The abraded contoners are titching is different from the abraded look far from
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Best Local Sim

Cellulase enzyme variants - having amino acid changes which improve properties e.g. activity, sensitivity to surfactants, pH optimum or

Example 3; Page 77-78; 115pp; English.

The present invention describes a cellulase enzyme variant comprising a catalytic core domain exhibiting cellulolytic activity which is derived CC from a naturally occurring parental cellulase by amino acid residue CC substitution, insertion and/or deletion; and (with cellulase numbering): CC (a) at position 5 has an Ala, Ser, or Thr residue; (b) at position 8 has CC a Phe or a Tyr residue; (c) at position 9 has a Phe, Trp, or Tyr residue; (d) at position 10 has a Asp residue; (e) at position 121 has a Asp CC (a) at present sequence represents the CDNA sequence of Humicola CC grisea cellulase from the present invention. The new cellulase enzymes CC can be used in e.g. detergent or fabric softener compositions, for biocypolishing of new fabrics, for promoting a stone-washed look to cellulase containing fabric, for pulp and paper applications, e.g. for debarking, defibration, fibre modification, drainage improvement, inter fibre CC bonding or for degradation of plant material e.g. for improving feed CC value. The cellulase variants have improved properties with respect to ce.g. catalytic activity, altered sensitivity to anionic tensides, pH or containing ractivity profile or stability.

                                                                                                                                                                                                                                                                                                                                                     PR XXX PA XXX PA XXX PA XXX
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence represents a novel hybrid gene construct from an example of the present invention. The present invention a describes a novel method for providing a novel DNA sequence encoding a polypeptide from a microorganism with an activity of interest. The method comprises: (i) PCR amplification of the DNA with PCR primers with homology to (a) known gene(s) encoding a polypeptide with an activity of interest; (ii) linking the obtained PCR product of a 5' structural gene sequence and a 3' structural gene sequence; (iii) expressing the resulting hybrid DNA sequence; (iv) screening for hybrid DNA sequences activity; and (v) isolating the hybrid DNA sequence identified in step (iv). This method provides for identification and isolation of sequences from microorganisms without having to cultivate and isolate the

coding sequence. The enzyme is a cellulase enzyme used in the liquid detergent composition of the invention. The detergent comprises an anion surfactant, a cellulase enzyme and a cellulase stabilising amount of an amine of the formula RIR2R3N; where RI and R2 are independently H or a C2-C9 alkyl chain, and R3 is a C2-C9 alkyl chain or cyclohexyl or cyclohexyl or cyclohexyl. The amine prevents the cellulase enzyme from becoming degraded. The composition is used as a liquid detergent, and has long term stability, it is applicable to the protection of an cellulase and the protection of an cellulase and the protection of an cellulase.

The enzyme can be produced recombinantly using the cDNA coding sequence and used in detergent compositions along with a surface active agent, a builder system and a softening clay. See also AAQ26407.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 1058 BP; 189 A; 376 C; 288 G; 205 T; 0 other;

The compsn. gives a detergent with good cleaning and softening performance due to the synergistic effect of the ammonium and cellolase components. The cellulase is a homogeneous endoglucanase componant which is immunoreactive with an antibody raised against a cellulase purified from Humicola isolens DSM 1800. See also AAQ25933.

The action of the PVP and the endoglucanase in fabric colour maintenance upon laundering is superior to the sum of the individual actions of both these ingredients.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence 1060 BP; 190 A; 377 C;

As a detergent additive, it has a higher degree of specithen Bacillus lentus serine protease. The term "higher degree of specificity" is defined as a protease which conditions degrades human the conditions degrades and protease which conditions degrades human the conditions degrades and protease which conditions degrades human the conditions

The present invention describes a novel method for providing a novel DNA sequence encoding a polypeptide from a microorganism with an activity of interest. The method comprises:

(i) PCR amplification of the DNA with PCR primers with homology to (a) known gene(s) encoding a polypeptide with an activity of interest; (ii) linking the obtained PCR product of a 5' structural gene sequence and a 3' structural gene sequence; (iii) expressing the resulting hybrid DNA sequence; (iv) screening for hybrid DNA sequences encoding a polypeptide with the activity of interest or a related activity; and (v) isolating the hybrid DNA sequence identified in step (iv). This method provides for identification and isolation of sequences from microorganisms
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Example 3; Page 47-48; 72pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Isolating novel DNA sequences from microorganisms - without the need

Spikes were sprayed with Fusarium graminearum (at what stage). Total RNA, and poly(A) RNA were prepared from infected spikes. cDNA was prepared using the SmartTM PCR cDNA synthesis kit from Clonetech. cDNA was cloned into the pGEM-T easy vector
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            /cultivar="Sumai3"

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              /note="regions could be compared to 100 gy gamma or 0.5, 1, 5, or 10 kJ/m2 UV irradiation. Gamma-irradiated samples were harvested at 6, 12, 24 and 48 hours after treatment. UV-irradiated samples were harvested 24 hours post-treatment. cDNA was prepared from polyA+ enriched, pooled samples of equivalent amounts of total RNA from each sample. The cDNA was directionally ligated into the Uni-Zap XR vector (Stratagene) and packaged using the Gigapack III Gold packaging extracts. Phagemids containing cDNA inserts were in vivo excised from the recombinant Uni-Zap XR vector using Exassist helper phage and the E. coli strain XLI-Blue MRF' (Stratagene). Excised plasmids were plated using SOLR
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        /tissue_type="seedlings"

modified polylinker; Site_1: EcoR I; Site_2: Not I;
UT-E-EJI is a subtracted cDNA library constructed
according to Bonaldo, Lennon and Soares, Genome Research,
6:791-806, 1996. First strand cDNA synthesis was primed
with an oligo-dT primer containing a Not I site. Double
stranded cDNA was ligated to an EcoR I adaptor, digested
with Not I, and cloned directionally into pT7T3-Pac
vector. The oligonuclectide used to prime the synthesis of
first-strand cDNA contains a library tag sequence that is
located between the Not I site and the (dT)18 tail. The
sequence tags for this library are: fetal eyes, AGAATCAAGA;
lens, CGATTAAGTG; retina, CCGCG; Retina Foveal and
Macular, GTCC; REE and Choroid, ACCTA. This library was
created for the program Gene Discovery in the Visual
